Welcome!
The Internet Society Deploy360 Programme is a new initiative that provides real-world IPv6, DNSSEC, etc. deployment information. Deploy360 aims to bridge the gap between the IETF standards process and final adoption of those standards by the global operations community. Deploy360 creates and promotes resources that are easy to understand and quickly actionable by the very IT professionals responsible for the implementation of new technologies and standards like IPv6 and DNSSEC. Something missing from this site? [Contact us](#) and we'll either find it or create it.

IPv6

- IPv6 Basics
- Tutorials and Online Training
- Case Studies

English content, initially, but will be translated into other languages.

Why Do I Need DNSSEC If I Have SSL?

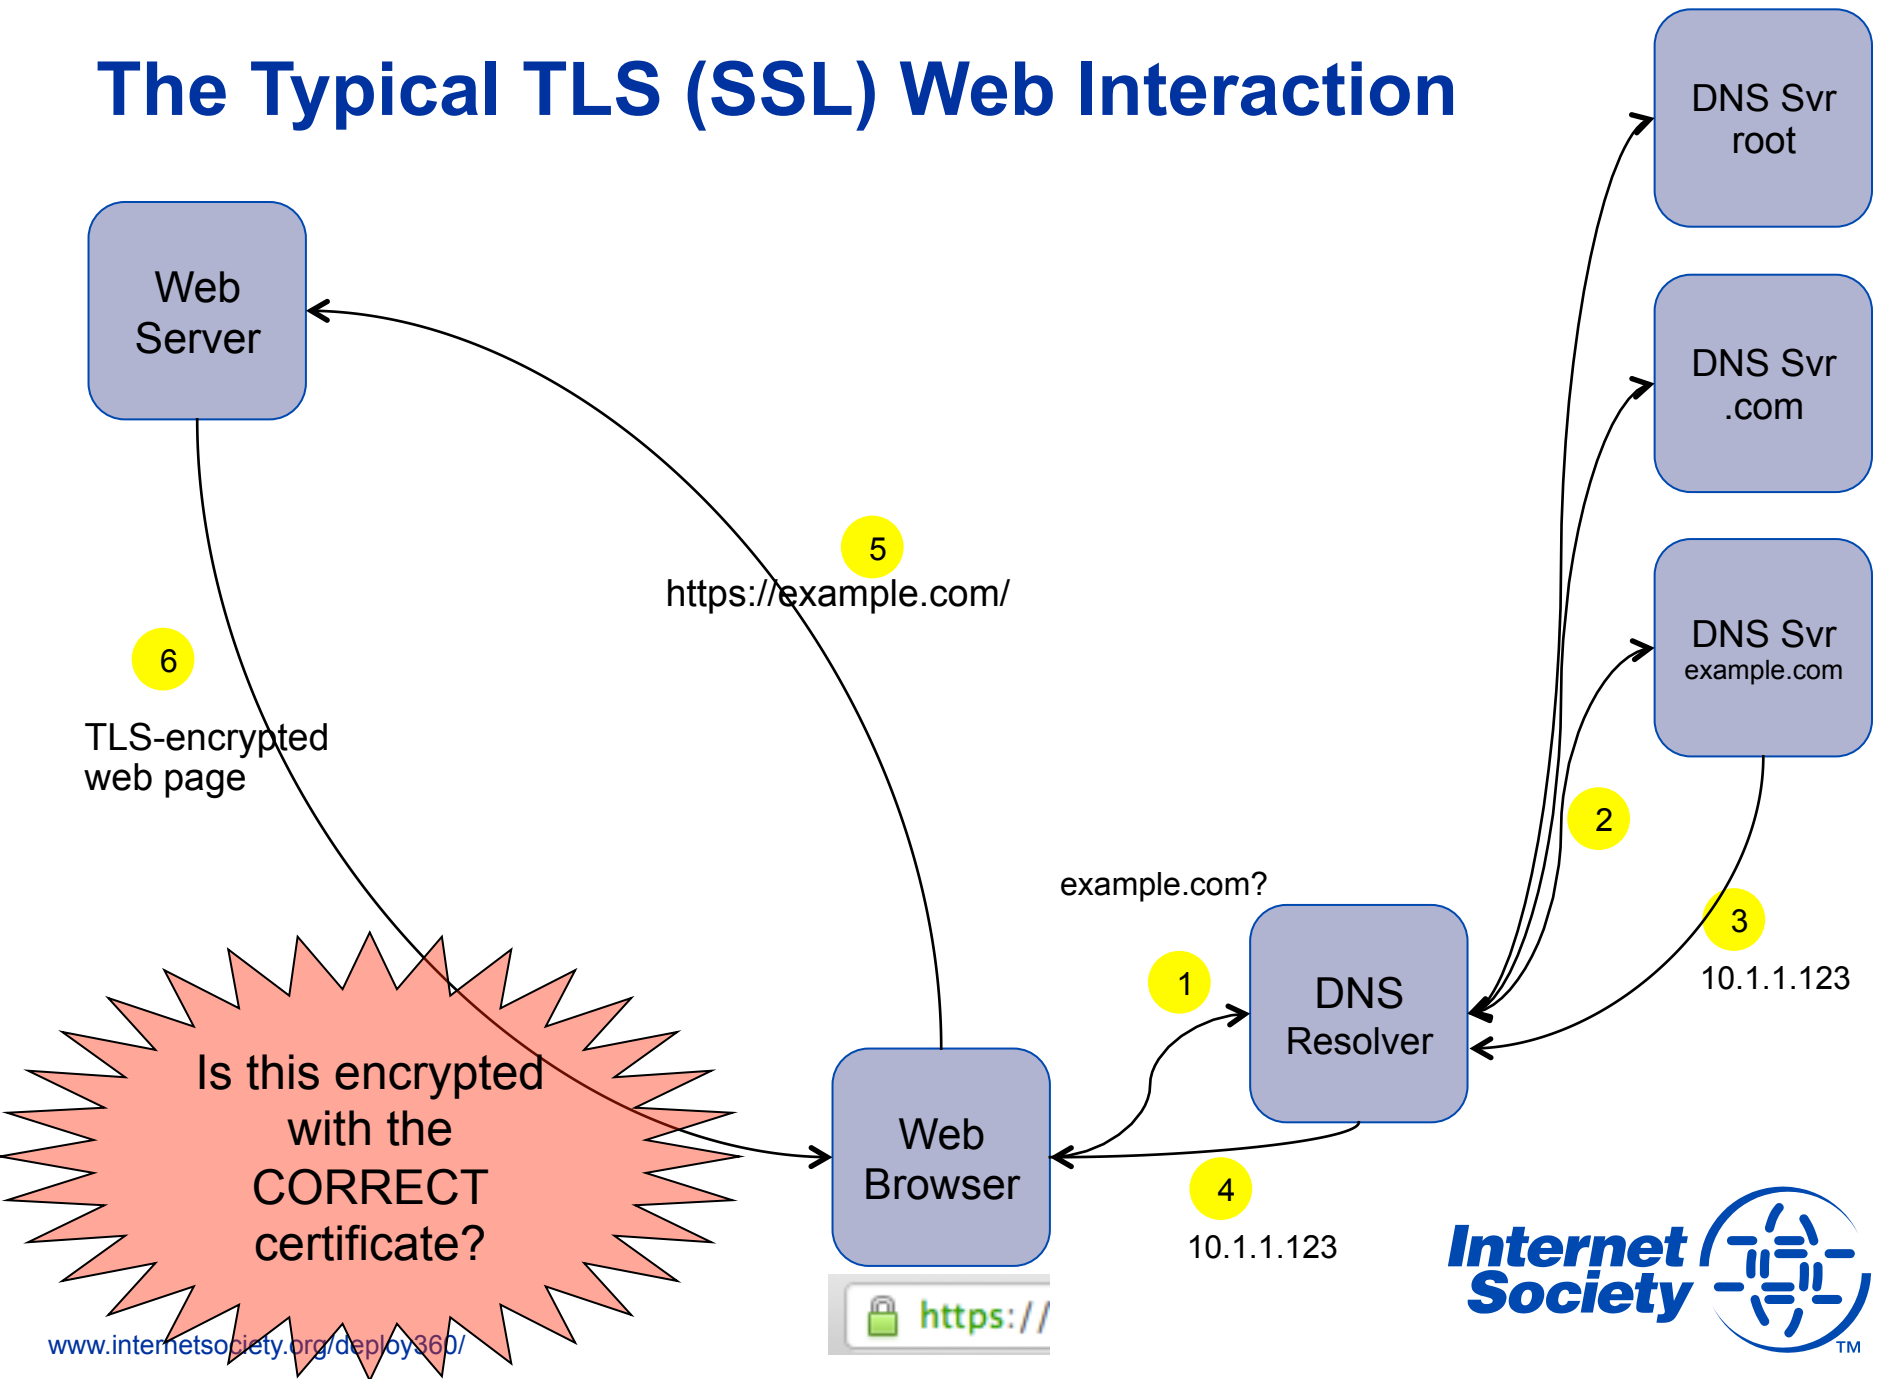

A common question:

- *why do I need DNSSEC if I already have a SSL certificate? (or an "EV-SSL" certificate?)*
- SSL (more formerly known today as Transport Layer Security (TLS)) solves a different issue – it provides encryption and protection of the communication between the browser and the web server

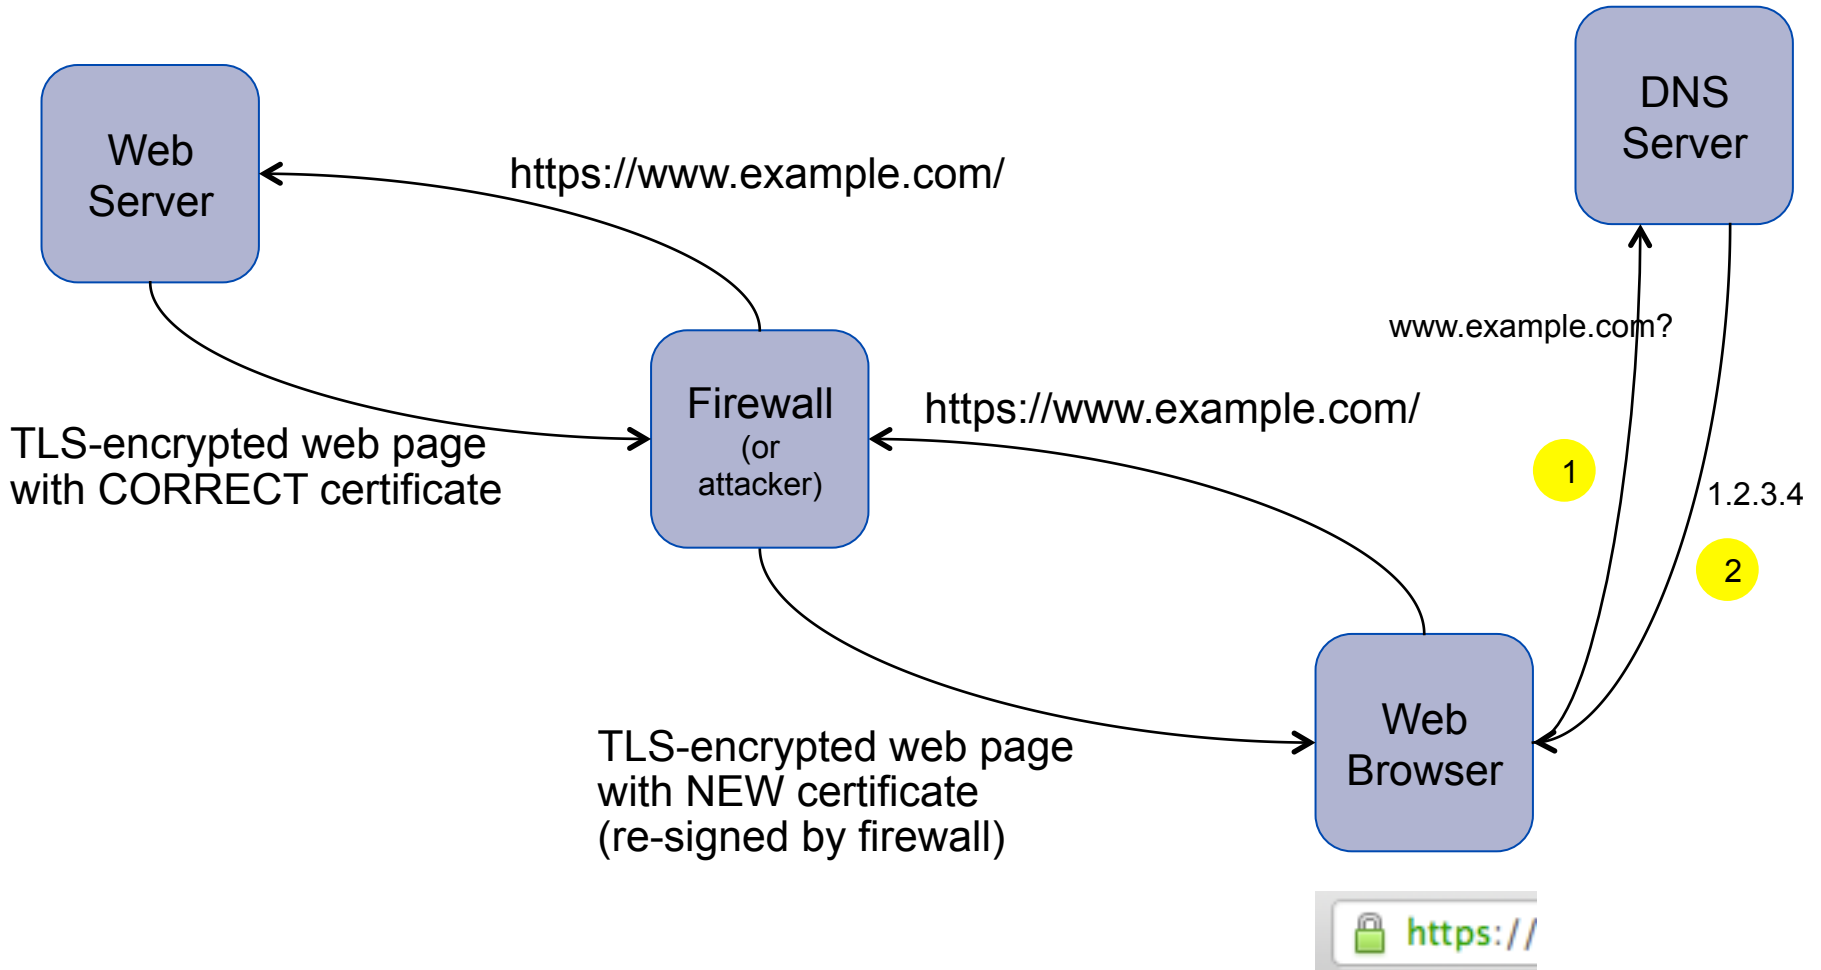

The Typical TLS (SSL) Web Interaction

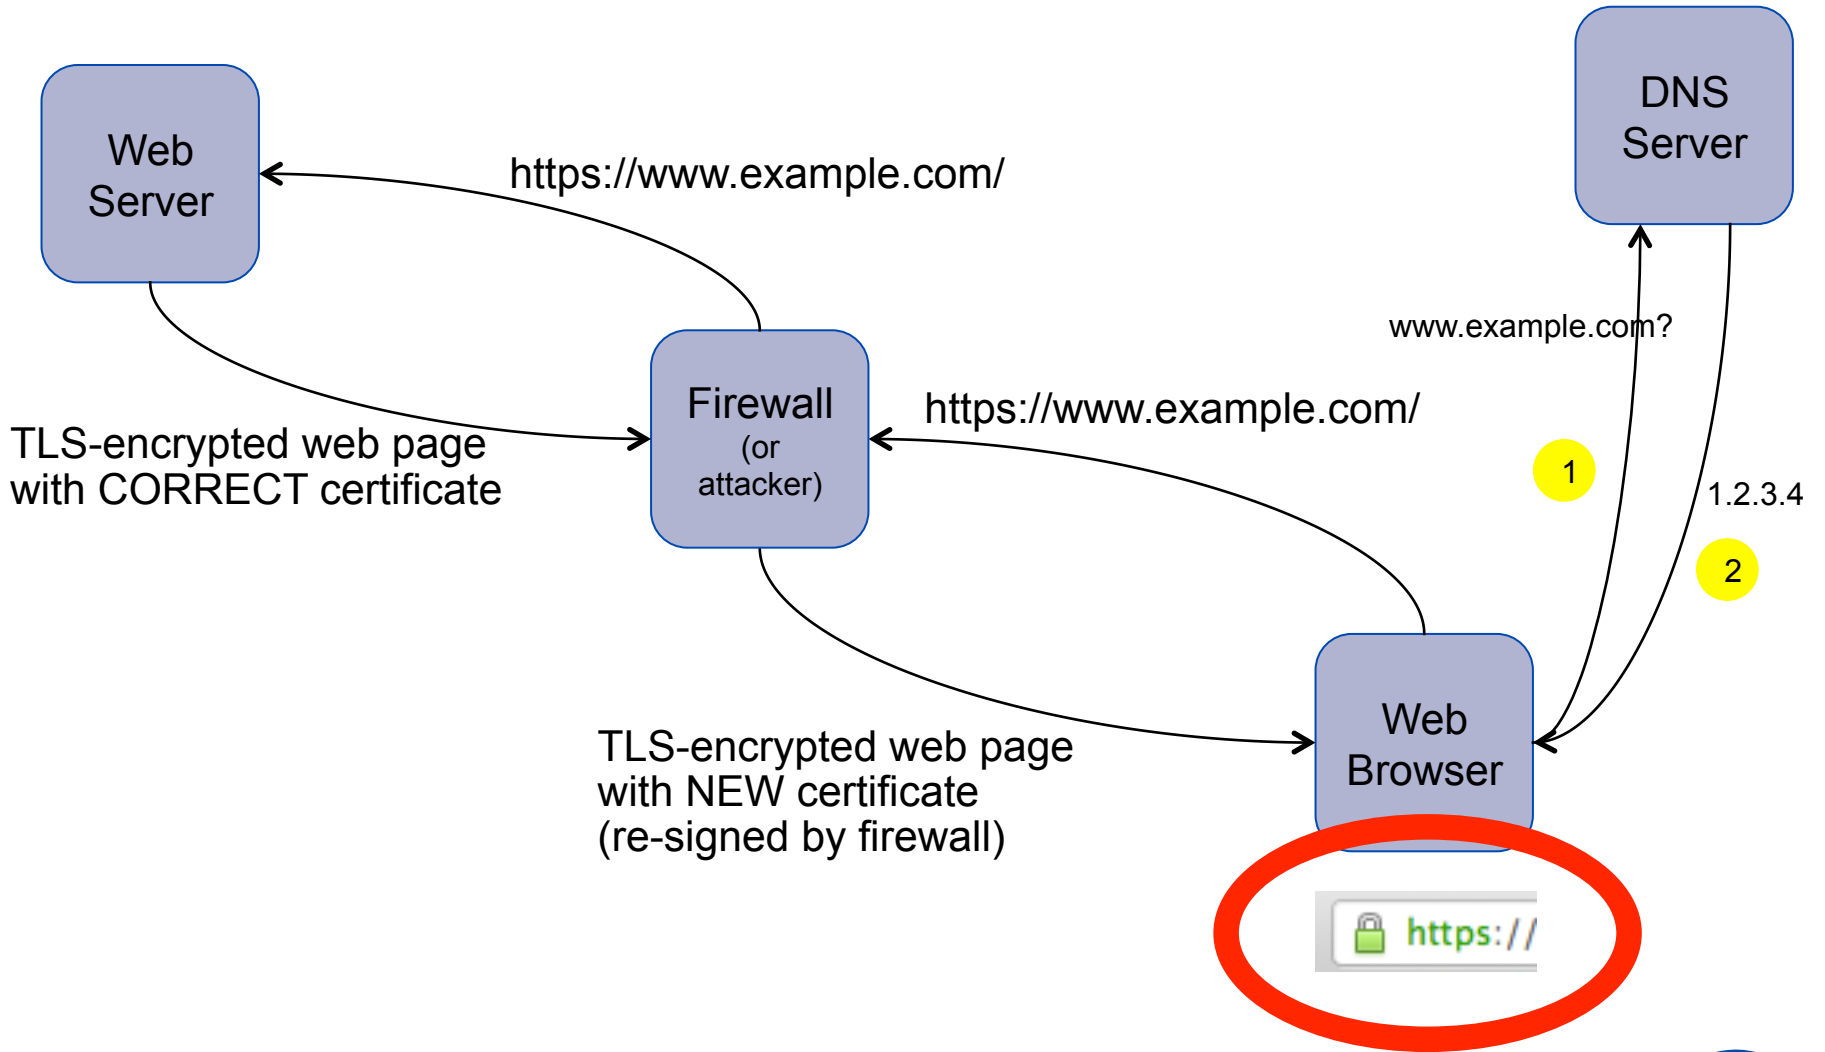

The Typical TLS (SSL) Web Interaction

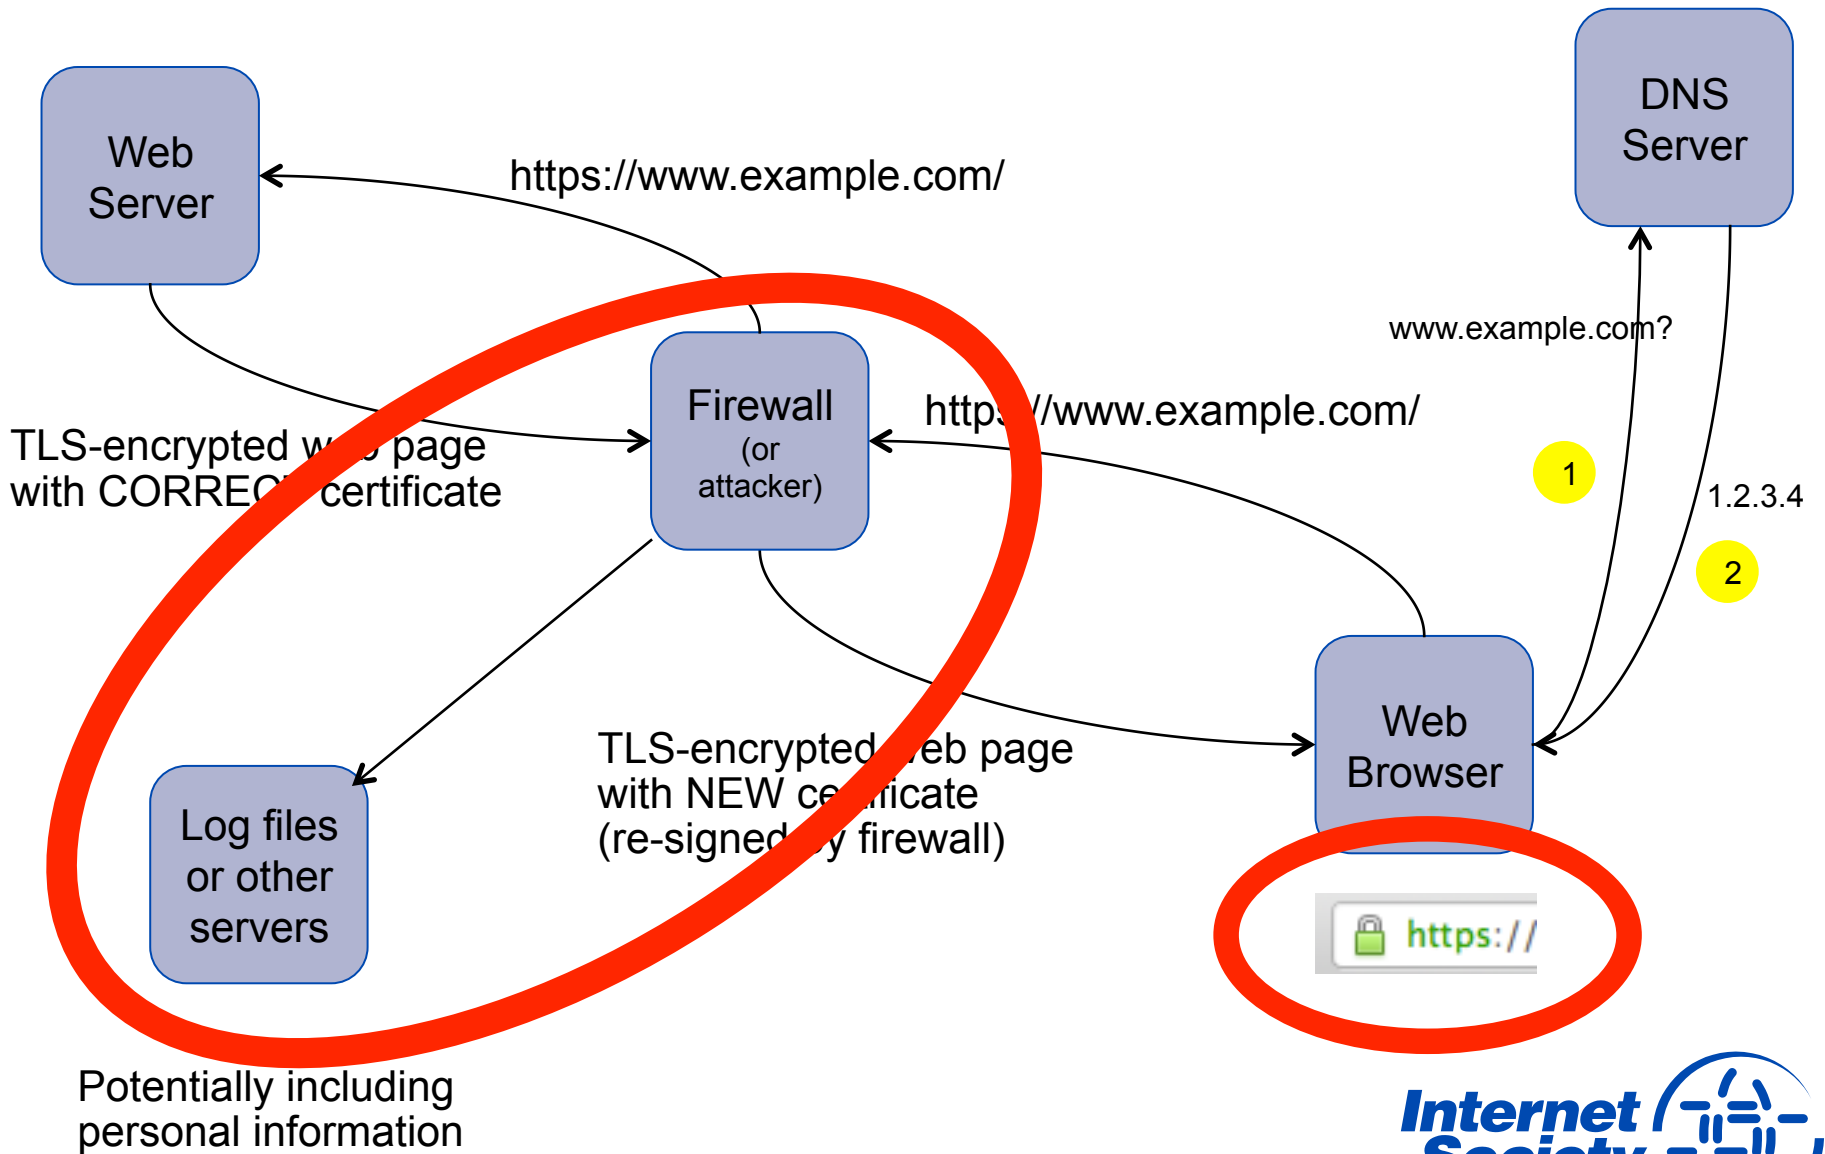

What About This?

Problems?

Problems?

Issues

A Certificate Authority (CA) can sign *ANY* domain.

Now over 1,500 CAs – there have been compromises where valid certs were issued for domains.

Some middle-boxes such as firewalls can re-sign sessions.

A Powerful Combination

- TLS = encryption + *limited* integrity protection
- DNSSEC = strong integrity protection
- How to get encryption + strong integrity protection?
- TLS + DNSSEC = **DANE**

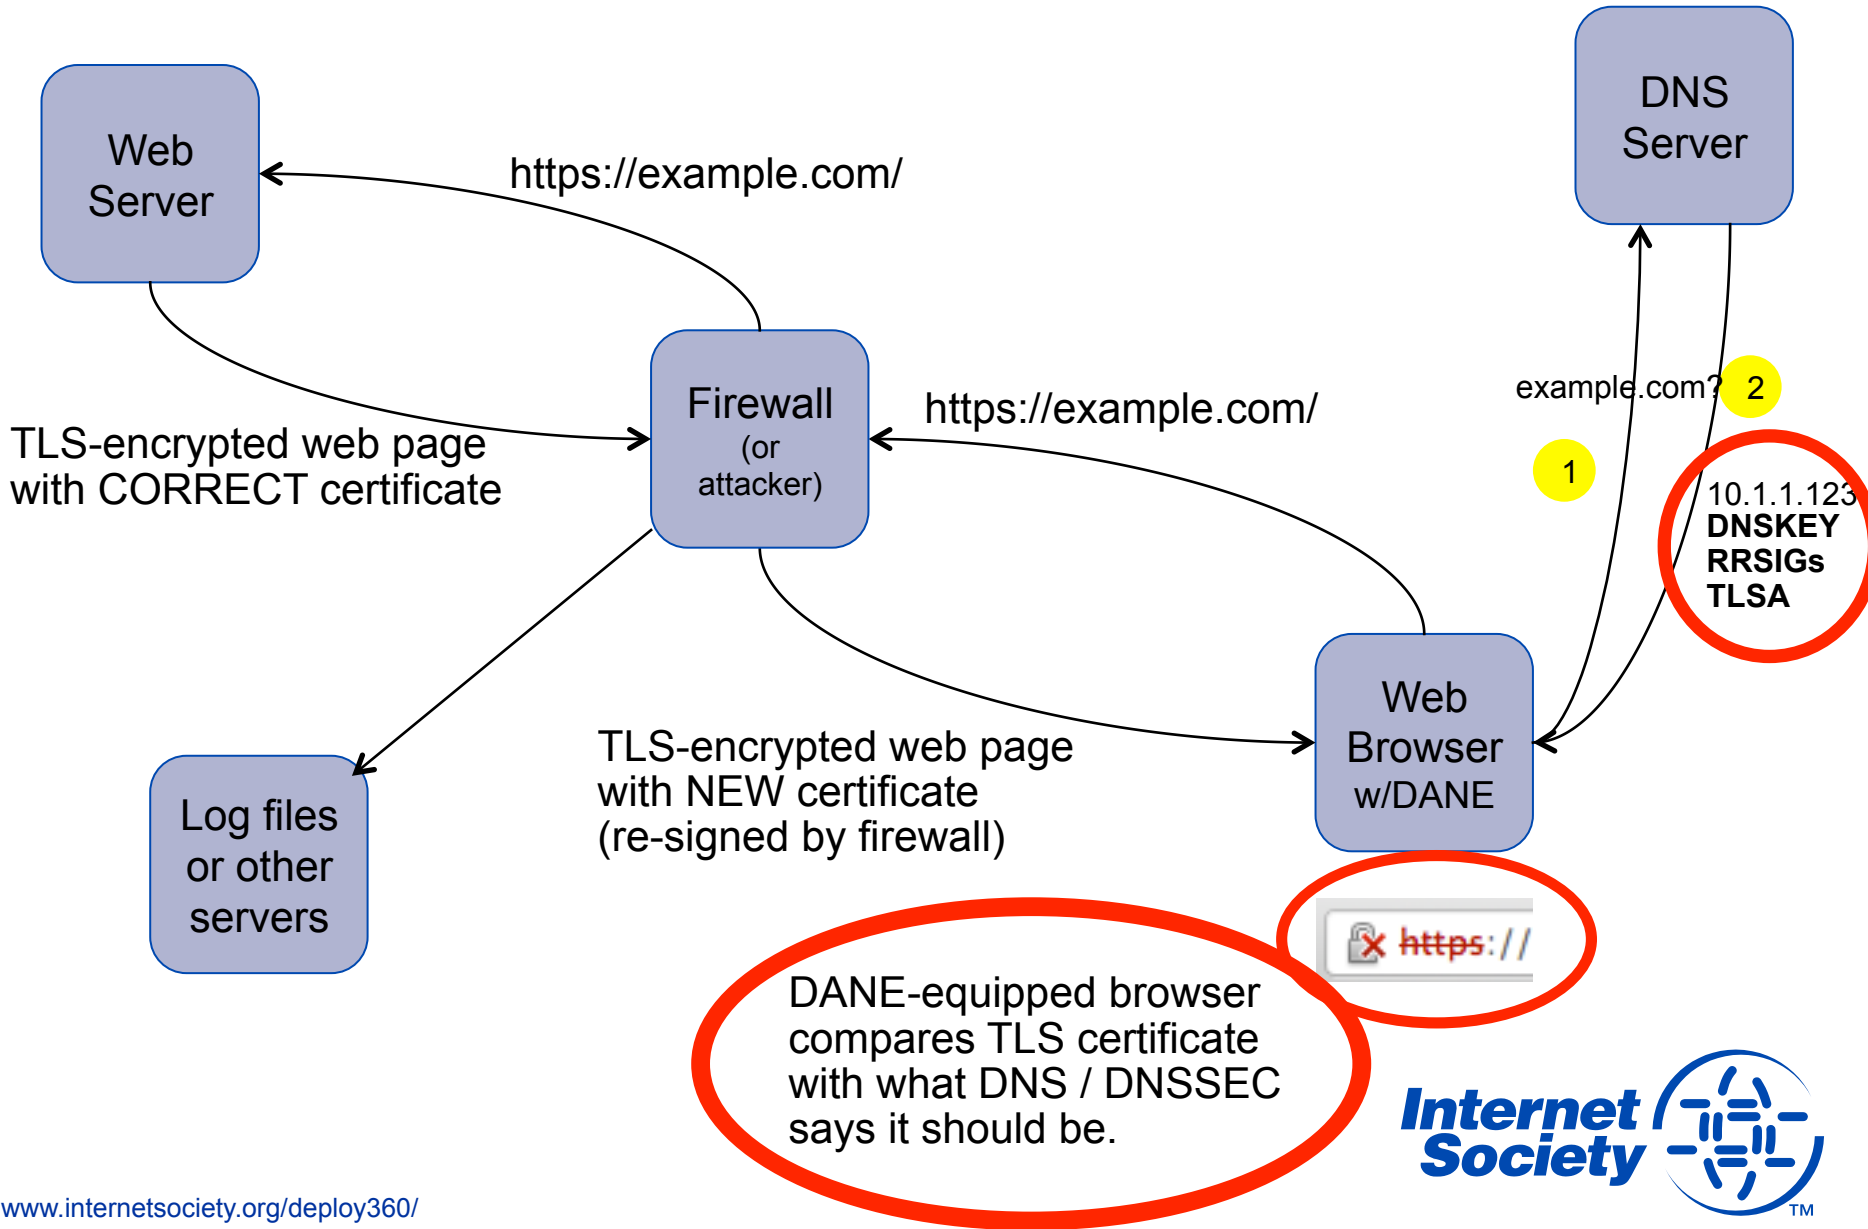

DNS-Based Authentication of Named Entities (DANE) – RFC 6698

- Q: How do you know if the TLS (SSL) certificate is the correct one the site wants you to use?
- A: Store the certificate (or fingerprint) in DNS (new TLSA record) and sign them with DNSSEC.

A browser that understand DNSSEC and DANE will then know when the required certificate is NOT being used.

Certificate stored in DNS is controlled by the domain name holder. It could be a certificate signed by a CA – or a self-signed certificate.

DANE

DANE – Not Just For The Web

- DANE defines protocol for storing TLS certificates in DNS
- Securing Web transactions is the obvious use case
- Other uses also possible:
 - Email
 - VoIP
 - Jabber/XMPP
 - ?

DANE Resources

DANE Overview and Resources:

- <http://www.internetsociety.org/deploy360/resources/dane/>

IETF Journal article explaining DANE:

- <http://bit.ly/dane-dnssec>

RFC 6394 - DANE Use Cases:

- <http://tools.ietf.org/html/rfc6394>

RFC 6698 – DANE Protocol:

- <http://tools.ietf.org/html/rfc6698>

How Do We Get DANE Deployed?

Developers:

- Add DANE support into applications (see list of libraries)

DNS Hosting Providers:

- Provide a way that customers can enter a “TLSA” record into DNS as defined in RFC 6698 (<http://tools.ietf.org/html/rfc6698>)
- This will start getting TLS certificates into DNS so that when browsers support DANE they will be able to do so.
- [More tools are needed to help create TLSA records – ex. hashslinger]

Network Operators / Enterprises / Governments:

- Start talking about need for DANE
- Express desire for DANE to app vendors (especially browsers)

Opportunities

- DANE is just *one* example of new opportunities brought about by DNSSEC
- Developers and others already exploring new ideas
