Contact data validation in FRED

Jaromir Talir • jaromir.talir@nic.cz • 18.11.2013
Agenda

- FRED
- To validate or not to validate
- Other approaches
- Our way
- Keeping contacts data valid
- Conclusion
FRED

- Open source registry software from CZ.NIC in development since 2007
- Used by CZ, AO, TZ, CR, FO, EE, AL
- Runs on Linux
  - Installation packages for Ubuntu and Fedora
- Full featured - EPP, ENUM, DNSSEC, IDN, WHOIS, ...
- http://fred.nic.cz
To validate or not to validate

- Registry is not for anonymous entities
- Major reasons for accurate data:
  - Resolution of legal issues
  - Resolution of technical issues (spam etc..)
  - Securing domains by notifying owners about events
- But there is a cost associated with validation
• SSAC Report on Domain Name Registration Data Validation (March 2013)
• Reasons for validation
• Taxonomy
  • Syntactical validation
  • Operational validation
  • Identity validation
• What attributes are subject of validation
Validation by registrars

- Registrars are responsible for contact data
  - According contract, they should provide sufficient effort for validation of data.
- New RAA for ICANN accredited registrars
  - Mandatory requirements for validation
  - Hardly applicable to our registrars
- Registry could be better place for validation
Different approaches

● Presentations from TechDay in Costa Rica:
  ● Turkey
    ● Registrants send documents via web portal
  ● Estonia
    ● For locals - integration with local eID and governmental registries
    ● For foreigners – after receiving money, registrars send bank account identity embedded in EPP
Our way

- Two complementary approaches
- Voluntary and automated
  - Send one-time codes to email, phone and postal address
- Selective and manual
  - Pro-active seeking of suspicious contacts and manual verification procedure
Voluntary

- Two phase procedure
  - Registrant enters handle of contact and codes are sent to him via email and sms
  - After collecting 2 codes, contact receives 1\textsuperscript{st} grade of validation and other code is sent via snail mail to postal address
  - After entering this code, contact receives 2\textsuperscript{nd} grade of validation
Voluntary

- For sms/letter delivery, we use third party web services – customizable by shell script
- Website for this process can be personalized by logo of registrar
- Level of validation is visible in EPP and WHOIS
- Contacts loose validation upon change
Voluntary

- Voluntary service must be marketed
- Marketing to registrants
  - Possibility to hide address in WHOIS
  - Small gifts (flash drive, etc.)
- Marketing to registrars
  - Level of participation of registry in co-marketing program depends on number of validated contacts
Selective

- System periodically randomly selects a group of contacts
- Each contact is first automatically checked for:
  - Syntactical correctness of data
  - Domain name of email exists and has MX records
  - Look up in available registries for streets and cities to check postal address
- Failed checks go into queue for manual checking by our helpdesk operators
Selective

- List of individual automatic checks is extensible
- Part of manual checking is written request to contact to correct data
- According registration rules, failure in manual checking may lead to dropping registration of all domains of this contact
Keeping contact data valid

- Generally hard, we try to support it by fighting with duplicities in contact data
  - More contacts user has, more probably he will forget to update them all
- We had ~ 15% of full duplicates
- Reasons? Could be simplicity of registrar interfaces
Keeping contact data valid

- New operation in registry – merge contact
  - Look up for full duplicates
  - Changing all linked objects to one contact
  - Delete second contact
  - Registrars/registrants are informed about result of merge operation
- Such “cleanup” is supposed to be done periodically
Conclusion

- Registry is suitable place to do validation of contact data
- Registry software can help a lot and FRED has wide support for validation, but some customization is needed
  - Integration with SMS / snail mail services
- Features and versions
  - Voluntary validation and merging – FRED-2.16
  - Selective validation – FRED-2.17 – later this year
Thank You
