

DNSSEC for Everybody: A Beginner's Guide

| ICANN58 | March 2017

THE URIGINS OF DWSSEC 5 RG

This is Ugwina. She lives in a cave on the edge of the Grand Canyon...

nominet*

This is Og. He lives in a cave on the other side of the Grand Canyon...

nominet

It's a long way down and a long way round. Ugwina and Og don't get to talk much...

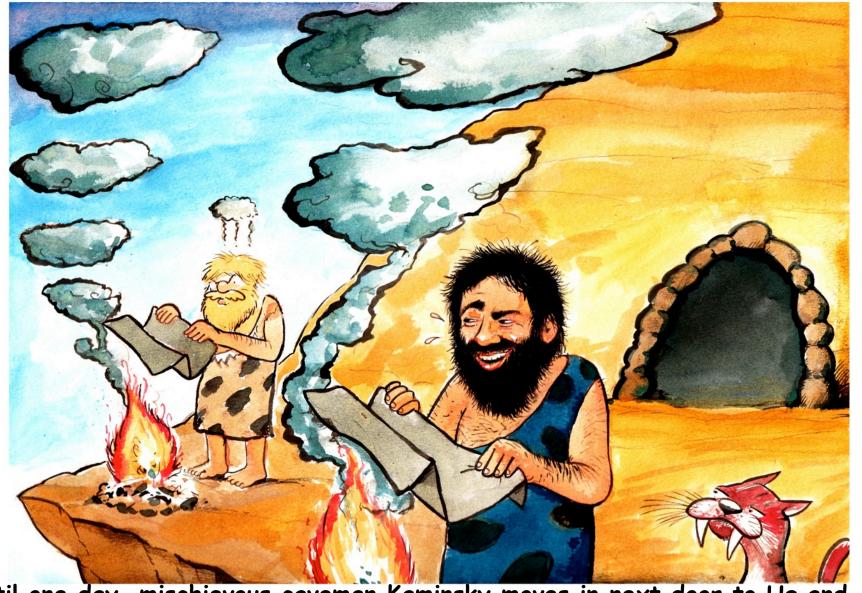

On one of their rare visits, they notice the smoke coming from Og's fire nominet

...and soon they are chatting regularly using smoke signals

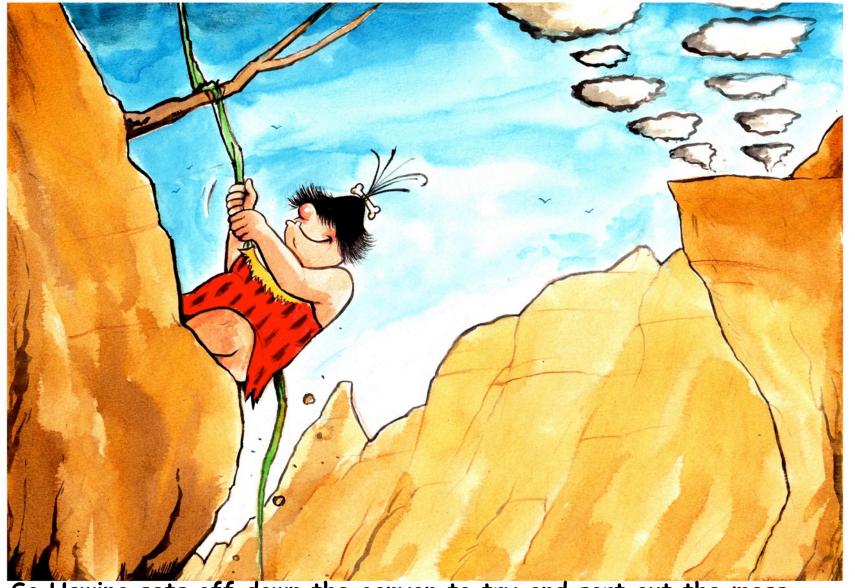

nominet®

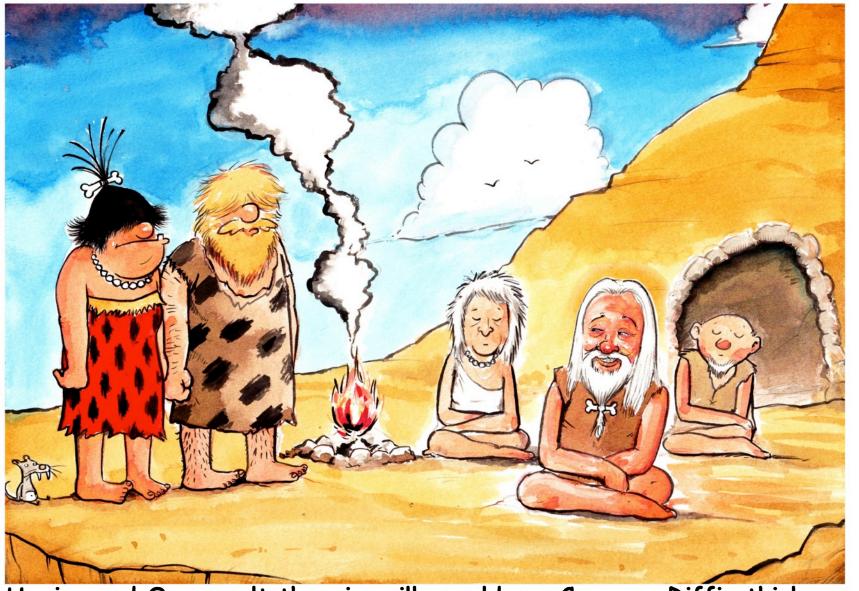

until one day, mischievous caveman Kaminsky moves in next door to Ug and starts sending smoke signals too...

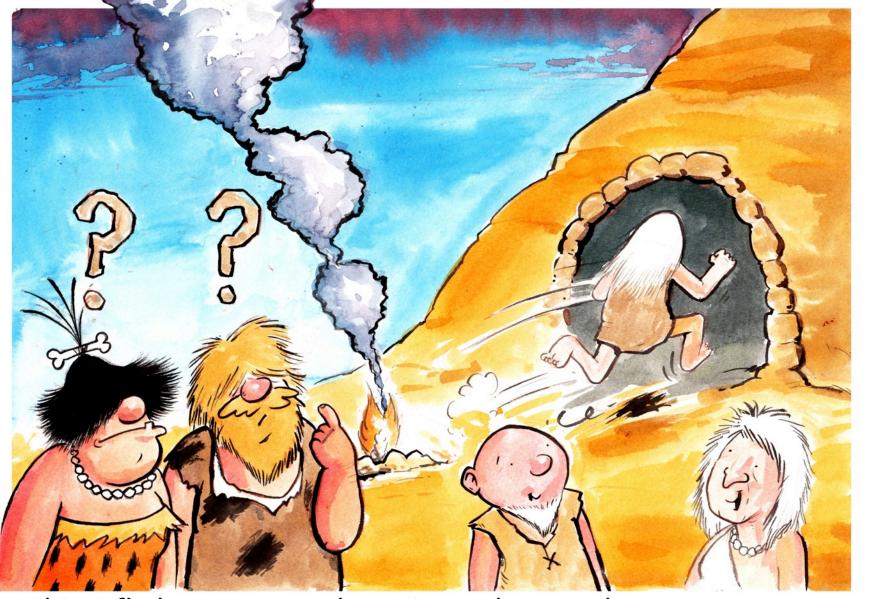

Now Ugwina is really confused. She doesn't know which smoke to believe...

So Ugwina sets off down the canyon to try and sort out the mess...

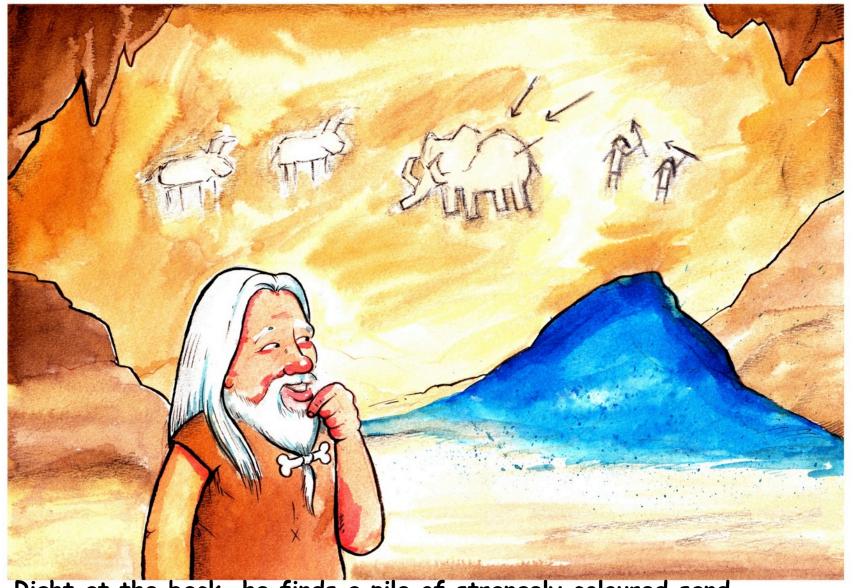

Ugwina and Og consult the wise village elders. Caveman Diffie thinks that he might have a cunning idea...

And in a flash, jumps up and runs into Ug's cave...!

nominet*

Right at the back, he finds a pile of strangely coloured sand that has only ever been found in Ug's cave...

nominet*

And with a skip, he rushes out and throws some of the sand onto the fire. The smoke turns a magnificent blue...

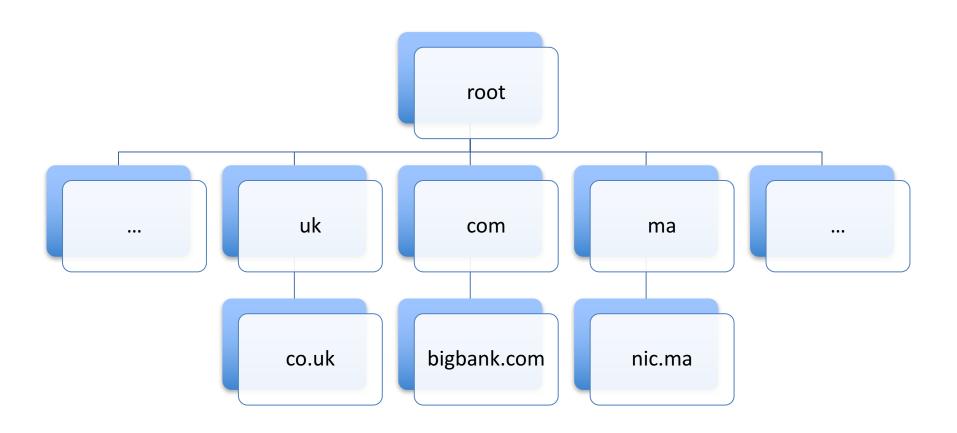

Now Ugwina and Og can chat happily again, safe in the knowledge that nobody can interfere with their conversation...

Introduction to DNSSEC

| Dan York, USC/ISI | ICANN58 | March 2017

- A resolver knows where the root-zone is
- Traverses the DNS hierarchy
- Each level refers the resolver to the next level
- Until the question has been answered
- The resolver caches all that information for future use.

- There is no security
- Names are easily spoofed
- Caches are easily poisoned

A Skit/Play

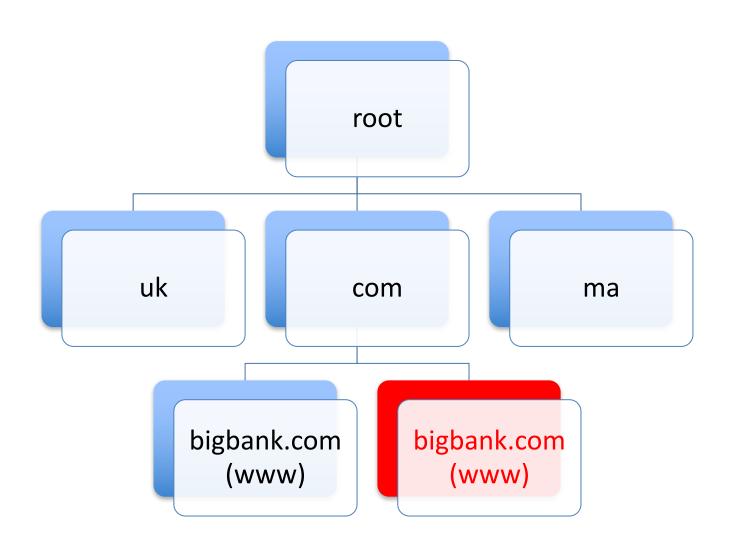

... Ugwina, the resolver, chatting with Og, the server...

...Ugwina, the resolver is confused. She doesn't know who the real Og is...

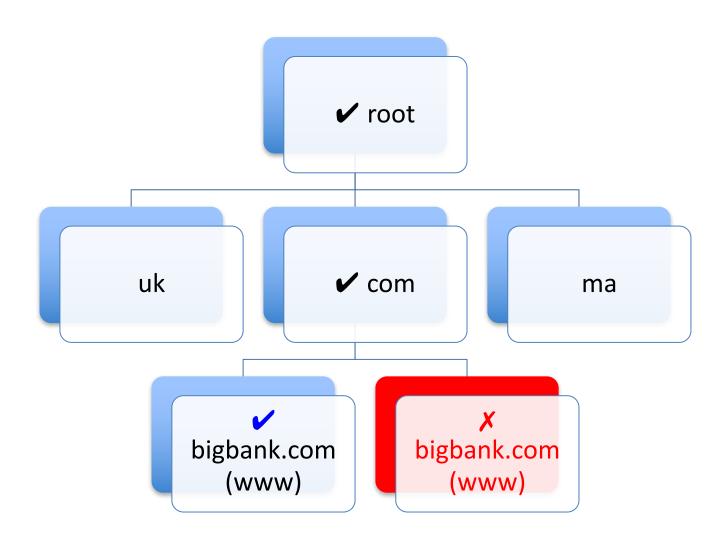

...Ugwina, the resolver, can verify that the real Og sends the message...

DNSSEC is the solution

- DNSSEC uses digital signatures to assure that information is correct and came from the right place.
- The keys and signatures to verify the information, is stored in the DNS as well
- Since DNS is a lookup system, keys can simply be looked up, like any data.

- A resolver knows what the root-key is
- It builds a Chain of Trust:
 - Each level signs the key of the next level
 - Until the chain is complete

A Skit/Play DNSSEC To The Rescue!

Example of Why You Need DNSSEC and a Simple Guide to Deployment

Russ Mundy, Parsons | ICANN58 | March 2017

Why Worry About DNS?

- Users think in terms of names
 - Applications primarily use DNS names
 - Internet uses network addresses to connect locations
- DNS provides the translation from names to network addresses
- Proper DNS functions required by essentially all Network Applications
 - If DNS doesn't work right,
 - the applications won't get to the intended locations

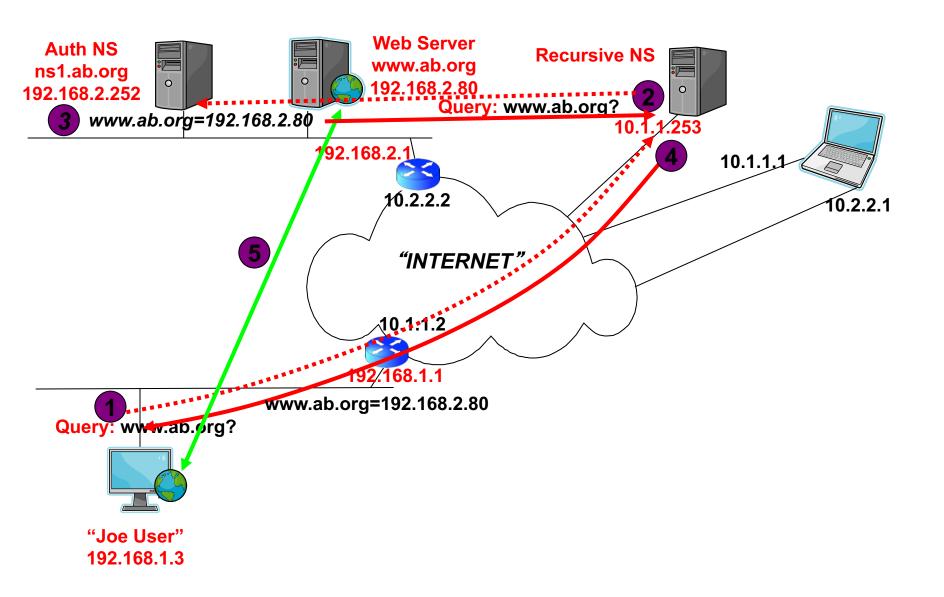

DNS Hijack Threat

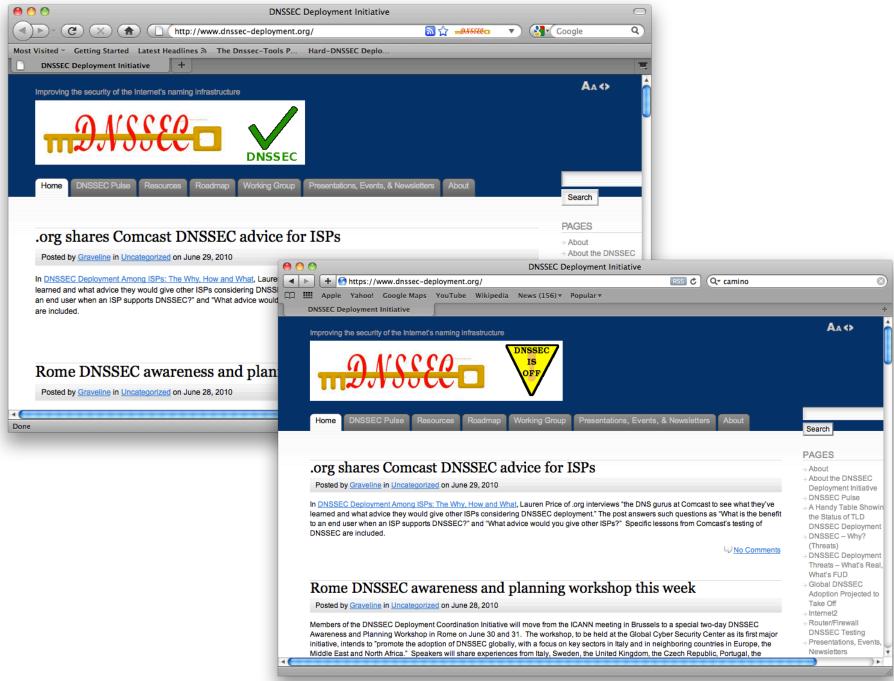

- DNS attacks provide a way to divert users' applications, e.g.,
 - Redirecting user applications to false locations to steal passwords or other sensitive information
 - Redirect to a man-in-the-middle location
 - See and copy an entire session: Web, email, IM, etc.
- Multiple DNS hijack tools available on the Internet
 - Some University courses have required students to write DNS hijack software as a class assignment!

How Can DNSSEC Help?

- DNSSEC can assure users they are reaching the right location
 - DNSSEC provides cryptographic information that can be used to verify that DNS information:
 - came from the proper source and
 - it was not changed enroute
- Hijack example will show DNSSEC preventing redirection of a web application
 - Web site tailored for effective use of DNSSEC and a web browser that uses DNSSEC

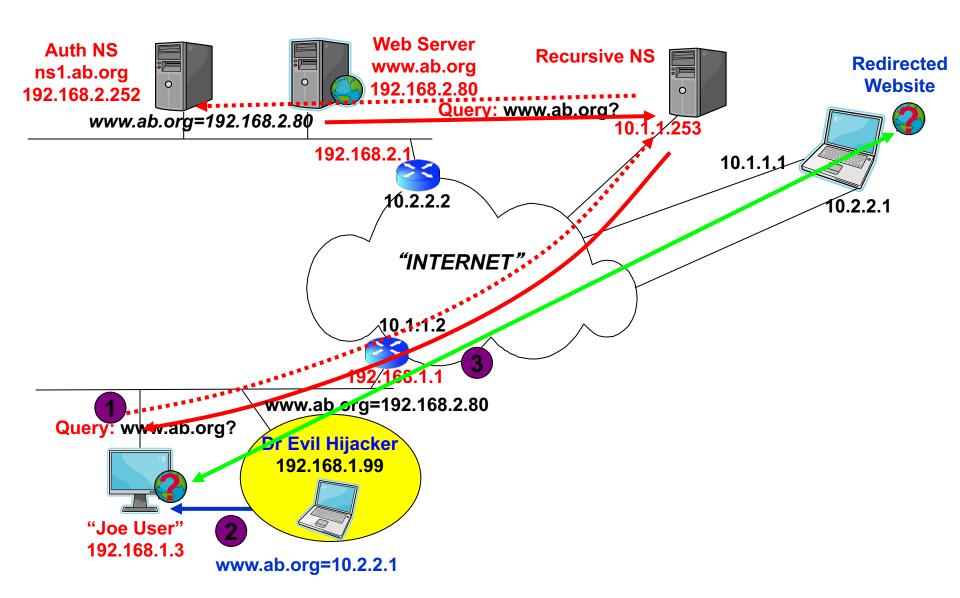

Normal DNS & Web Exchange

DNS Basic Functions

- DNS provides the translation from names to network addresses
- Get the right DNS content to Internet users
- ➤IT'S **DNS ZONE DATA** THAT MATTERS!

DNSSEC Implementation Samples

- DNSSEC implementation depends upon & is mostly driven by an activity's DNS functions
 - DNS is made up of many parts, e.g., name server operators, applications users, name holders ("owners"), DNS provisioning
 - Activities with large, complex DNS functions are more likely to have more complex DNSSEC implementation activities
 - Also more likely to have 'DNS knowledgeable' staff

DNSSEC Implementation Samples, Continued

- DNS size and complexity examples:
 - Registry responsible for a large TLD operation,
 e.g., .com
 - Substantial enterprise with many components with many geographic locations, e.g., hp.com
 - Internet-based businesses with a number of business critical zones, e.g., www.verisign.com
 - Activities with non-critical DNS zones, e.g., netsnmp.org
 - Proverbial Internet end users (all of us here)

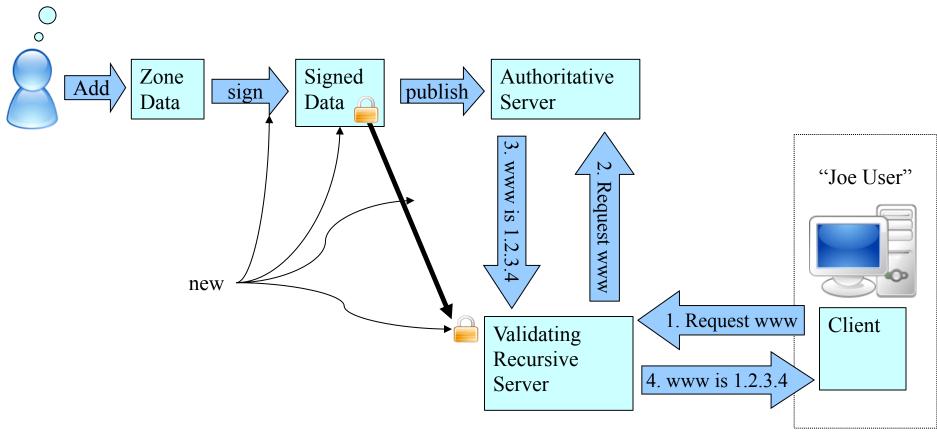

How Does DNSSEC Fit?

- DNSSEC required to thwart attacks on DNS CONTENT
 - DNS attacks used to attack Internet users applications
- ➤ Protect DNS ZONE DATA as much as (or more than) any DNSSEC information
 - ➤ Including DNSSEC private keys!!

Simple Addition of DNSSEC

(there are both much more and less complex setups than this)

russ.mundy@parsons.com

General Principle:

- If an activity does a lot with their DNS functions and operations then they probably will want to do a lot with the associated DNSSEC pieces;
- If an activity does little or nothing with their DNS functions and operations then they probably will do little or nothing directly with their DNSSEC elements but Require DNSSEC from their suppliers

Thank You and Questions
